

## OpenGL Texture Mapping

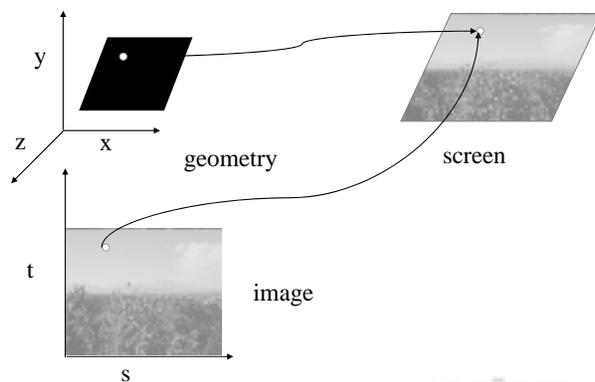

### Objectives

- Introduce the OpenGL texture functions and options

## Basic Strategy

- Three steps to applying a texture
  1. specify the texture
    - read or generate image
    - assign to texture
    - enable texturing
  2. assign texture coordinates to vertices
    - Proper mapping function is left to application
  3. specify texture parameters
    - wrapping, filtering

## Texture Mapping

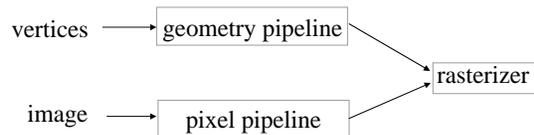

## Texture Example

- The texture (below) is a 256 x 256 image that has been mapped to a rectangular polygon which is viewed in perspective

## Texture Mapping and the OpenGL Pipeline

- Images and geometry flow through separate pipelines that join at the rasterizer
  - “complex” textures do not affect geometric complexity

KENT STATE 5

## Specify Texture Image

- Define a texture image from an array of *texels* (texture elements) in CPU memory

```
GLubyte my_texels[512][512];
```
- Define as any other pixel map
  - Scan
  - Via application code
- Enable texture mapping
  - `glEnable(GL_TEXTURE_2D)`
  - OpenGL supports 1-4 dimensional texture maps

KENT STATE 6

## Define Image as a Texture

```
glTexImage2D( target, level, components,  
             w, h, border, format, type, texels );
```

**target:** type of texture, e.g. `GL_TEXTURE_2D`  
**level:** used for mipmapping (discussed later)  
**components:** elements per texel  
**w, h:** width and height of *texels* in pixels  
**border:** used for smoothing (discussed later)  
**format and type:** describe texels  
**texels:** pointer to texel array

```
glTexImage2D(GL_TEXTURE_2D, 0, 3, 512, 512, 0,  
            GL_RGB, GL_UNSIGNED_BYTE, my_texels);
```

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 7

## Converting A Texture Image

- OpenGL requires texture dimensions to be powers of 2
- If dimensions of image are not powers of 2

```
gluScaleImage( format, w_in, h_in,  
              type_in, *data_in, w_out, h_out,  
              type_out, *data_out );
```

  - `data_in` is source image
  - `data_out` is for destination image
- Image interpolated and filtered during scaling

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 8

## Mapping a Texture

- Based on parametric texture coordinates
- `glTexCoord*()` specified at each vertex

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 9

## Typical Code

```
glBegin(GL_POLYGON);
  glColor3f(r0, g0, b0);
  glNormal3f(u0, v0, w0);
  glTexCoord2f(s0, t0);
  glVertex3f(x0, y0, z0);
  glColor3f(r1, g1, b1);
  glNormal3f(u1, v1, w1);
  glTexCoord2f(s1, t1);
  glVertex3f(x1, y1, z1);
  :
  :
glEnd();
```

Note that we can use vertex arrays to increase efficiency

KENT STATE 10

## Interpolation

OpenGL uses bilinear interpolation to find proper texels from specified texture coordinates

Can be distortions

good selection  
of tex coordinates

poor selection  
of tex coordinates

texture stretched  
over trapezoid  
showing effects of  
bilinear interpolation

KENT STATE 11

## Texture Parameters

- OpenGL: a variety of parameter that determine how texture is applied
  - *Wrapping parameters* determine what happens if  $s$  and  $t$  are outside the  $(0,1)$  range
  - *Filter modes* allow us to use area averaging instead of point samples
  - *Mipmapping* allows us to use textures at multiple resolutions
  - *Environment parameters* determine how texture mapping interacts with shading

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 12

## Wrapping Mode

Clamping: if  $s, t > 1$  use 1, if  $s, t < 0$  use 0

Wrapping: use  $s, t$  modulo 1

```
glTexParameteri( GL_TEXTURE_2D,
                 GL_TEXTURE_WRAP_S, GL_CLAMP )
glTexParameteri( GL_TEXTURE_2D,
                 GL_TEXTURE_WRAP_T, GL_REPEAT )
```

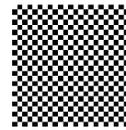

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 13

## Wrapping Mode

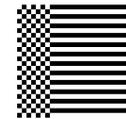

Repeat in s and t

Clamp in s and t

Clamp in s, Repeat in t

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

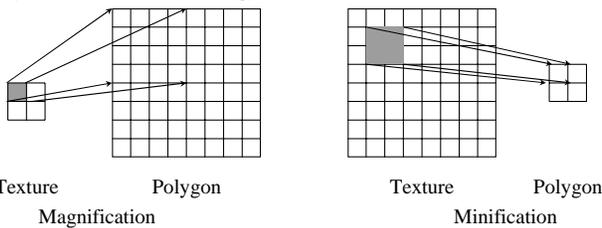

KENT STATE 14

## Magnification and Minification

Texel smaller than pixel – more than one texel can cover a pixel (*minification*)

Texel larger than pixel - more than one pixel can cover a texel (*magnification*)

Can use point sampling (nearest texel -fastest) or linear filtering (2 x 2 filter – less aliasing) to obtain texture values

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 15

## Filter Modes

Modes determined by

```
-glTexParameteri( target, type, mode )
```

```
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER,
                 GL_NEAREST);
```

```
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER,
                 GL_LINEAR);
```

Note that linear filtering requires a border of an extra texel for filtering at edges (border = 1)

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 16

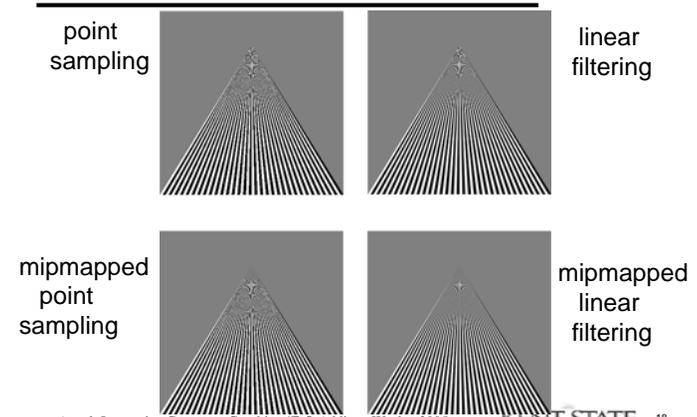

## Mipmapped Textures

- *Mipmapping* allows for prefiltered texture maps of decreasing resolutions
- Lessens interpolation errors for smaller textured objects
- Declare mipmap level during texture definition  
`glTexImage2D( GL_TEXTURE_2D, level, ... )`
- GLU mipmap builder routines will build all the textures from a given image  
`gluBuild2DMipmaps( ... )`  
\* is 2, 3, 4 in above

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 17

## Example

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 18

## Texture Functions

- Controls how texture is applied
  - `glTexEnv{f|v}( GL_TEXTURE_ENV, prop, param )`
- `GL_TEXTURE_ENV_MODE` modes
  - `GL_MODULATE`: (default) modulates with computed shade ( $tex\_shade * shader\_shade$ )
  - `GL_BLEND`: blends with an environmental color
  - `GL_DECAL/GL_REPLACE`: use only texture color
  - `GL( GL_TEXTURE_ENV, GL_TEXTURE_ENV_MODE, GL_MODULATE );`
- Set blend color with `GL_TEXTURE_ENV_COLOR`

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 19

## Perspective Correction Hint

- Texture coordinate and color interpolation
  - either bilinearly in screen space
  - or using depth/perspective values (slower)
- Noticeable for polygons “on edge”
  - `glHint( GL_PERSPECTIVE_CORRECTION_HINT, hint )`  
where `hint` is one of
    - `GL_DONT_CARE`
    - `GL_NICEST`
    - `GL_FASTEST`

Angel: Interactive Computer Graphics 4E © Addison-Wesley 2005

KENT STATE 20

## Generating Texture Coordinates

---

- OpenGL can generate texture coordinates automatically
  - `glTexGen{ifd}[v]()`
- specify a plane
  - generate texture coordinates based upon distance from the plane
- generation modes
  - `GL_OBJECT_LINEAR`
  - `GL_EYE_LINEAR`
  - `GL_SPHERE_MAP` (used for environmental maps)

## Texture Objects

---

- Texture is part of the OpenGL state
  - If we have different textures for different objects, OpenGL will be moving large amounts data from processor memory to texture memory
- Recent versions of OpenGL have *texture objects*
  - one image per texture object
  - Texture memory can hold multiple texture objects

## Applying Textures II

---

1. specify textures in texture objects
2. set texture filter
3. set texture function
4. set texture wrap mode
5. set optional perspective correction hint
6. bind texture object
7. enable texturing
8. supply texture coordinates for vertex
  - coordinates can also be generated

## Other Texture Features

---

- Environmental Maps
  - Start with image of environment through a wide angle lens
    - Can be either a real scanned image or an image created in OpenGL
  - Use this texture to generate a spherical map
  - Use automatic texture coordinate generation
- Multitexturing
  - Apply a sequence of textures through cascaded texture units
