

Kent State University Dept. of Computer Science	
CS 4/59995 Internet Engineering	LECT-1B

Class Mechanics

- Web Access:
 - in04s/winter
- Groups Project
 - Next class we will form groups of 1-2
 - group work/ individual report.
 - 2 phases + optional creative enhancement
 - In class group demonstration
- Class attendance will be important.
- Personal information.

Applications & Services

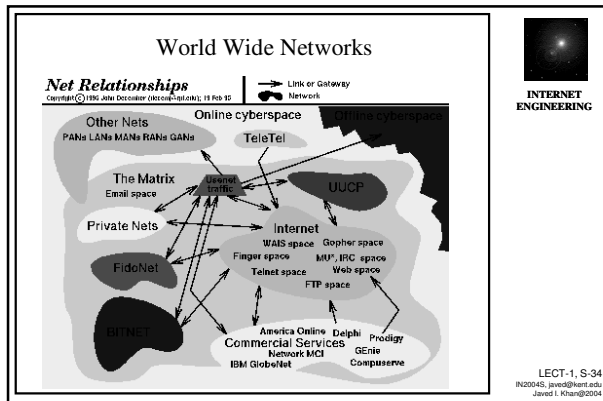

The real story of the Internet excitement is however is the new genre of systems and applications developed on it.

The Internet offer access to data, graphics, sound, software, text, and people through a variety of services and tools for communication and data exchange:

- Hypertext (WWW)
- Remote login (telnet)
- File transfer (ftp)
- Electronic mail (e-mail)
- News (USENET or network news)
- Platform independent computing (Java)
- E-commerce, Digital Library, Online Banking
- Virtual University, Tele-medicine

Javed I. Khan@2004

Who Manages Internet?

35

There is no single body which manages the Internet.

It runs through a host of independent or loosely coupled coordinating organizations.

The organizations below play a major role in the organization, management and development of it:

- Internet Society (ISOC)
- Internet Architecture Board (IAB)
- Internet Engineering Task Force (IETF)
- Internet Engineering Steering Group (IESG)
- Internet Assigned Number Authority (IANA)
- W3C

LECT-1, S-36
IN2004S_javed@kent.edu
Javed I. Khan@2004

Internet Society (ISOC)

A nonprofit, non-governmental professional-membership organization of individuals and organizations interested in the development of Internet. More specifically, this is the legal umbrella for other coordinating bodies (such as IAB, IANA) for global cooperation and coordination for the Internet and its internetworking technologies and applications.

LECT-1, S-37
IN2004S_javed@kent.edu
Javed I. Khan@2004

Internet Architecture Board (IAB)

IAB is a technical advisory group of the Internet Society. Its responsibilities include oversight of IETF, editorship of the RFC document series, administration of Internet assigned numbers, and liaison of the Internet Society in liaison relationships with other organizations concerned with standards.

LECT-1, S-38
IN2004S_javed@kent.edu
Javed I. Khan@2004

Internet Engineering Task Force (IETF)

Body to address and resolve technical and operational problems on the Internet and to develop Internet standards and protocols.

The membership of IETF is international and completely voluntary. Members consist of network designers, operators, vendors, researchers and other interested individuals.

LECT-1, S-39
IN2004S_javed@kent.edu
Javed I. Khan@2004

Internet Assigned Numbers Authority (IANA):

Based at ICANN, IANA is in charge of all "unique parameters" on the Internet, including IP (Internet Protocol) addresses and manages the Root Domain Name Service.

Global Village

As of January 1998, 205 countries had at least one connection to the Internet. Thus only 11 new countries joined the Internet in 1997. This is a diminished Internet spread rate, but it occurs for the simple reason that there aren't many new countries to join.

Javed I. Khan@2004

1960's

1969 - The Department of Defense Advanced Research Projects Agency creates an experimental network called ARPANET. This network provides a test-bed for emerging network technologies.

ARPANET originally connected four universities

- Node 1: UCLA - (September)
- Node 2: SRI - Stanford Research Institute (October)
- Node 3: UCSB
- Node 4: University of Utah

ENGINEERING

LECT-1, S-63
IN2004S_javed@hert.edu
Javed I. Khan@2004

1970'S

1971 ALOHAnet developed by Norman Abrahamson, University of Hawaii, heart of Ethernet and connected to the ARPANET in 1972.

1972 The National Center for Supercomputing Applications (NCSA) develops the telnet application for remote login, making it easier to connect to a remote computer.

1973 **FTP** (file transfer protocol) is introduced, standardizing the transfer of files between networked computers.

INTERNET
ENGINEERING

LECT-1, S-64
IN2004S_javed@kent.edu
Javed I. Khan@2004

1970'S

1972 Ray Tomlinson (BBN) writes basic email message send and read software (March) Larry Roberts writes first email utility to list, selectively read, file, forward, and respond to messages (July)

1973 Bob Metcalfe's Harvard Ph.D. Thesis outlines idea for Ethernet.

1976 Elizabeth II, Queen of the United Kingdom sends out an e-mail (various Net folks have e-mailed dates ranging from 1971 to 1978)

UUCP (Unix-to-Unix Copy) developed at AT&T Bell Labs and distributed with UNIX one year later.

INTERNET
ENGINEERING

LECT-1, S-65
IN2004S_javed@kent.edu
Javed I. Khan@2004

1980's

1981 BITNET, the "Because It's Time NETWORK" Started as a cooperative network at the City University of New York, with the first connection to Yale.

CSNET (Computer Science NETWORK) built by a collaboration of computer scientists and University of Delaware, Purdue University, University of Wisconsin, RAND Corporation and BBN through seed money granted by NSF to provide networking services (especially email) to university scientists with no access to ARPANET.

INTERNET
ENGINEERING

LECT-1, S-66
IN2004S_javed@kent.edu
Javed I. Khan@2004

1980's

- **1983** Name server developed at Univ of Wisconsin, no longer requiring users to know the exact path to other systems.
- Internet Activities Board (IAB) established, replacing ICCB
- Berkeley releases 4.2BSD incorporating TCP/IP.
- EARN (European Academic and Research Network) established. Very similar to the way BITNET works with a gateway funded by IBM. FidoNet developed by Tom Jennings.
- **1984** Domain Name System (DNS) introduced. Number of hosts breaks 1,000
- JUNET (Japan Unix Network) established using UUCP.

INTERNET
ENGINEERING

LECT-1, S-67
IN2004S_javed@kent.edu
Javed I. Khan@2004

1980's

• **1983** The TCP/IP suite of networking protocols, or rules, becomes the only set of protocols used on the ARPANET. This decision sets a standard for other networks, and generates the use of the term "Internet" as the network of networks which either use the TCP/IP protocols or are able to interact with TCP/IP networks.

• To keep military and non-military network sites separate, the ARPANET splits into two networks: ARPANET and MILNET.

INTERNET
ENGINEERING

LECT-1, S-68
IN2004S_javed@kent.edu
Javed I. Khan@2004

1980's Continued..

• In 1982 and 1983, the first desktop computers began to appear. Many are equipped with an operating system called Berkeley UNIX, which includes networking software. This allows for relatively easy connection to the Internet using telnet.

• The personal computer revolution continues through the eighties, making access to computer resources and networked information increasingly available to the general public.

INTERNET
ENGINEERING

LECT-1, S-69
IN2004S_javed@kent.edu
Javed I. Khan@2004

1980's Continued..

1985-86: The National Science Foundation (NSF) connects the nation's six supercomputing centers together. This network is called the NSFNET, or NSFNET backbone.

To expand access to the Internet, the NSF supported the development of regional networks, which were then connected to the NSFNET backbone. In addition, the NSF supported institutions, such as universities, in their efforts to connect to the regional networks.

Here is a diagram of the NSF backbone, as it appeared in

INTERNET
ENGINEERING

LECT-1, S-70
IN2004S_javed@kent.edu
Javed I. Khan@2004

1980's

1987 - The NSF awards a grant to Merit Network, Inc. to operate and manage future development of the NSFNET backbone. Merit Network, Inc. collaborates with IBM and MCI to research and develop faster networking technologies.

1988 2 November - Internet worm burrows through the Net, affecting ~6,000 of the 60,000 hosts on the Internet.

1989 - The backbone network is upgraded to "T1" from 56Kbps which means that is able to transmit data at speeds of 1.5 million bits of data per second, or about 50 pages of text per second.

INTERNET
ENGINEERING

LECT-1, S-71
IN2004S_javed@kent.edu
Javed I. Khan@2004

1990's

1990 - The ARPANET is dissolved.

1991 - Gopher is developed at the University of Minnesota. Gopher provides a hierarchical, menu-based method for providing and locating information on the Internet. This tool makes using the Internet much easier.

1992 - Internet Society (ISOC) is chartered
Number of hosts breaks 1,000,000

1993 - The European Laboratory for Particle Physics in Switzerland (CERN) releases the World Wide Web (WWW), developed by Tim Berners-Lee. The WWW uses hypertext transfer protocol (HTTP) and hypertext links, changing the way information can be organized, presented and accessed on the Internet.

INTERNET
ENGINEERING

LECT-1, S-72
IN2004S_javed@kent.edu
Javed I. Khan@2004

1990's

1993 - The NSFNET backbone network is upgraded to "T3" which means that it is able to transmit data at speeds of 45 million bits of data per second, or about 1400 pages of text per second.

1993-1994 - The graphical web browsers Mosaic and Netscape Navigator are introduced and spread through the Internet community. Due to their intuitive nature and graphical interface, these browsers make the WWW and the Internet more appealing to the general public.

1995 - The NSFNET backbone is replaced by a new network architecture, called vBNS (very high speed backbone network system) that utilizes Network Service Providers, regional networks and Network Access Points (NAPs).

INTERNET
ENGINEERING

LECT-1, S-73
IN2004S_javed@kent.edu
Javed I. Khan@2004

1995

1995 - RealAudio, an audio streaming technology, lets the Net hear in near real-time

1995 Radio HK, the first commercial 24 hr., Internet-only radio station starts broadcasting

1995 NSF establishes the very high speed Backbone Network Service (vBNS) linking super-computing centers: NCAR, NCSA, SDSC, CTC, PSC

Technologies of the Year: WWW, Search engines

Emerging Technologies: Mobile code (JAVA, JAVAscript), Virtual environments (VRML), Collaborative tools
