

Subnetting

Subnetting & Masks

- IP address is depleting faster than expected:
 - All network, even one with 2 hosts, need at least class C address.
 - A network with 256 hosts need class B address.
- Also, the more there is networks, the bigger the routing table gets.
- Solution is *subnetting*.
 - A network can be divided into subnets.
 - Outside routers still view them as one large network.
 - Only, the local routers see them as separate networks.

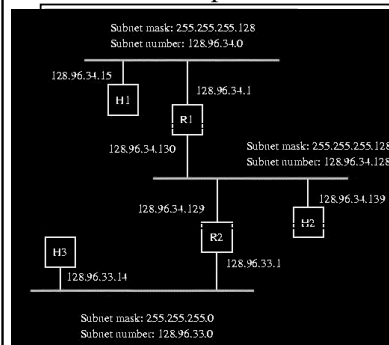

Subnet Masks

- Now in each routing table both the network number and the mask is stored.
- An AND operation is performed before looking up for the next hop.
- For distant networks, the mask is of type A, B, or C. But for local network, the mask is longer.

Example of Subnet

But the administrator of 128.96.34.0 has divided its network into two physical networks 128.96.34.0 and 128.96.34.128 with mask 255.255.255.128

Network 128.96.34.0 is class B address and can have about 256x256 hosts in one large network

H3 in 128.96.33.0 sees everything in 128.96.34.0 as one single network.

IP Datagram Forwarding: with IP

What is Bit Mask?

- R2's routing table

- IP- Internet Protocol
 - Addressing Scheme
 - Address Resolution
 - Datagram Forwarding
 - Encapsulation, Fragmentation & Reassembly
- TCP- Transmission Control Protocol
 - Connection startup & shutdown
 - Reliability: ordering, missing data handling

Encapsulation

- Datagrams have to travel via a physical network. But, a physical network has its own Frame format. A Datagram, therefore must be encapsulated.

```

    graph TD
      subgraph IP_Packet [IP Packet]
        direction LR
        IP_Head[IP Header] --- IP_Data[IP Data Area]
      end
      subgraph Frame [Frame]
        direction LR
        Frame_Head[Frame Header] --- Frame_Data[Frame Data]
      end
      IP_Packet --> Frame
  
```

- The destination address in the Frame header is the address of the next hop.

IN20045, javed@hert.edu
Javed I. Khan@2004

Transmission across Internet

```

    graph TD
      SH[Source host] -- datagram --> N1((Net 1))
      N1 -- "header 1 datagram" --> R1[Router 1]
      R1 -- datagram --> N2((Net 2))
      N2 -- "header 2 datagram" --> R2[Router 2]
      R2 -- datagram --> N3((Net 3))
      N3 -- "header 3 datagram" --> DH[Destination host]
  
```

INTERNET ENGINEERING

Encapsulation applies to one network at a time. However, in Internet the journey requires series of transmission over many different Networks.

LECT-6, S-60
IN20045, javed@hert.edu
Javed I. Khan@2004

MTU and Datagram Size

- Each Network on its way generally has their own maximum transmission unit size (MTU). How can IP routers overcome this obstacle?

```

    graph LR
      H1[H1] --- N1((Net 1 MTU=1500))
      N1 --- R[R]
      R --- N2((Net 2 MTU=1000))
      N2 --- H2[H2]
  
```

INTERNET ENGINEERING

LECT-6, S-61
IN20045, javed@hert.edu
Javed I. Khan@2004

Fragmentation

- Datagrams are fragmented into multiple segments, if it faces a Network with MTU smaller than the datagram size.
- Each fragment has the same format as the datagram, except a bit flag which indicates that it is a fragment, not the entire datagram.
- FRAGMENTOFFSET field indicates where in the original datagram the fragment data belongs.

```

    graph TD
      subgraph Original [Original Datagram]
        direction LR
        OH[IP Header] --- ODDA[original datagram data area]
      end
      ODDA --> FH1[IP Hdr 1]
      ODDA --> FH2[IP Hdr 2]
      ODDA --> FH3[IP Hdr 3]
      FH1 --- D1[data 1]
      FH2 --- D2[data 2]
      FH3 --- D3[data 3]
  
```

VERSION	DLEN	SERVICE TYPE	TOTAL LENGTH
0	0	0	0
IDENTIFICATION		FLAG	FRAGMENT OFFSET
TIME TO LIVE		TYPE	HEADER CHECKSUM
SOURCE IP ADDRESS			
DESTINATION IP ADDRESS			
POPTIONS (MAY BE OMITTED)		PADDING	
BEGINNING OF DATA			

INTERNET ENGINEERING

LECT-6, S-62
IN20045, javed@hert.edu
Javed I. Khan@2004

Reassembly

- Because each fragment has a copy of the original header, and an indication flag that it is a fragment, the original datagram can be reassembled at the end.

```

    graph LR
      H1[H1] --- N1((Net 1 MTU=1500))
      N1 --- R1[R1]
      R1 --- N2((Net 2 MTU=1000))
      N2 --- R2[R2]
      R2 --- N3((Net 3 MTU=1500))
      N3 --- H2[H2]
  
```

H1 sends 1500B, but it is fragmented by R1. But, R2 does not reassemble them although Net3 MTU is 1500!

IP specifies only the destination should reassemble fragments.

Datagram Identification

- individual fragments can arrive out of order. How IP reassembles out of order fragments?
 - Sender inserts a unique number in IDENTIFICATION field. This with FRAGMENT OFFSET helps in restoring out of order.
- IP does not guarantee delivery and thus fragments can be lost. How IP handles such loss?
 - The same two fields helps in identifying a missing fragment.
 - After receiving the first FRAGMENT, receiver starts a timer. If the entire datagram does not arrive within a specified time, it discards all fragments.
 - But, it does not notify the sender!

VERSION	DLEN	SERVICE TYPE	TOTAL LENGTH
0	0	0	0

ICMP

67

ICMP: An Error Control/Reporting Message Protocol

- IP is a best effort mechanism. But provides no guarantee of delivery.
- However, it is not careless!
- ICMP is a mechanism by which network elements can pass information about the source/cause of errors, and also warn each other about potential problem.
- ICMP defines 5 error messages and 4 information messages.

LECT-6, S-68
IN2004S, javed@hert.oxa
Javed I. Khan@2004

ICMP: Error Messages

- SOURCE QUENCE
 - send by overworked routers to the sources of discarded datagrams.
- TIME EXCEEDED
 - send by router for packets whose TIME TO LIVE filed has expired.
- DESTINATION UNREACHABLE
 - send by routers who could not find forwarding address.
- REDIRECT
 - if a router thinks, not him, but some other router should have received the packet.
- FRAGMENTATION REQUIRED
 - if the fragment as required permission is not given to a router, it can request source to send fragmented datagrams

LECT-6, S-69
IN2004S, javed@hert.oxa
Javed I. Khan@2004

ICMP: Informational Messages

- ECHO/ REQUEST/REPLY
 - An echo request message can be sent to any ICMP host in a network. It sends replies.
 - Ping!
- ADDRESS MASK REQUEST/REPLY
 - A host, when boots can request for the correct address mask for the network. The router in the network send the correct 32 bit address mask.

ICMP Packets over IP

INTERNET
ENGINEERING

LECT-6, S-71
IN2004S_javed@rent.edu
Javed I. Khan@2004

Some Example of ICMP Services

- Ping
 - send a datagram with ICMP echo request.
- Trace a Route
 - send IP packets with TIME TO LIVE set to 1, 2, 3, etc.
- Path MTU Discovery
 - set a FLAG bit in IP messages so that it cannot be fragmented by routers.
 - Send large messages and wait for FRAGMENT REQUIRED ICMP message to come back.
 - Do experiment with various data sizes!
