Advanced Algorithms
Final Exam Info

Date: **Tuesday, December 12, 2017, 8:15 - 10:30 p.m.**

- This is a closed book exam; only 1 sheet of notes (handwritten and readable w/o magnification) is permitted.
- You will have 135 minutes for this exam.
- It will consist of 5 problems worth 50 points each, plus a problem 6 for extra credit.
- The extra credit will be recorded separately, so make sure you have answered all questions from first 5 problems before moving on to problem 6.
- All questions will be taken from the sections Amortized Analysis, Parallel Algorithms, NP-completeness, Approximation Algorithms, and Max Flow and Matching.

**Possible Questions:** A problem may consist of few questions. You should expect a question of the form: work through some algorithm on a given input, showing intermediate results. I'll pick the algorithm at random, because I want you to learn them all. For some more complex algorithms, I may only ask you to do one iteration. You should also expect a series of short answer questions. Although the answers are short, some of the questions may require some thought. Don't worry about skipping a question (or guessing an answer) if you don't see the answer right away. The other problems will involve giving proofs, designing and analyzing algorithms. These are much more unpredictable. I try to ask at least a couple of questions that involve a very simple modification to a homework problem, so be sure you understand the solutions to all the homework problems. Other questions usually involve a slight modification to a problem that we have worked on. Finally, I have one challenging problem. Don't be upset if you cannot solve this problem. (But at least be sure to read it, since sometimes the problem is not as challenging as I think it is, and there may be a very simple solution.) If you cannot see how to solve the problem, feel free to write down your wild ideas or observations. You might get some partial credit if your idea is good. When it comes to grading, I tend to give more credit for "insight" than for "memorization". For example, if a problem involves 2-appr. algorithm for the TSP problem, you will not get any credit for just writing down the algorithm. (You could just copy that out of your cheat sheet.) However, if you can say something intelligent about the mathematical structure of the particular problem, or about why some approach is not useful, you may get some partial credit (depending on how much your observation indicates about your understanding of the problem).
