

Sets

Sets

Set Operations

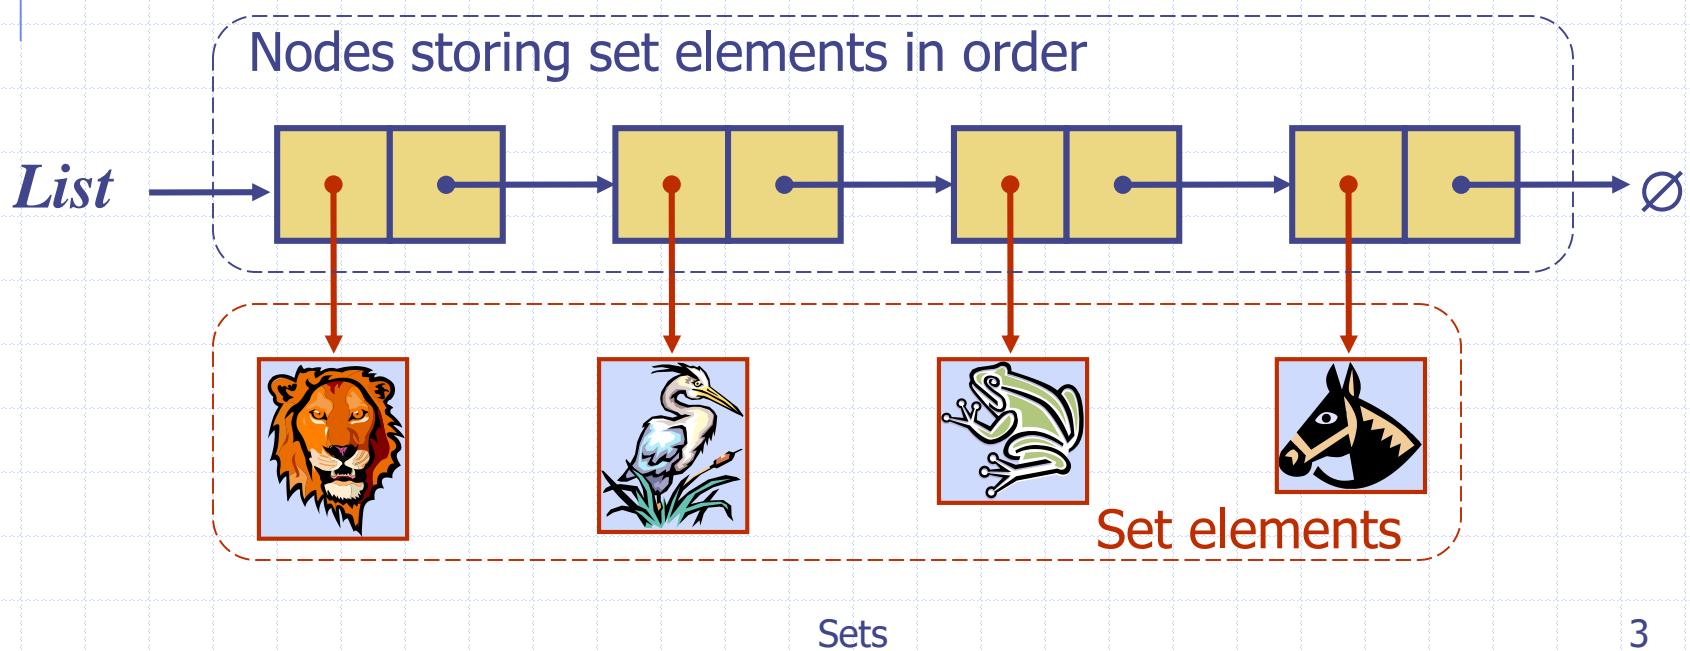

- ◆ We represent a set by the sorted sequence of its elements
- ◆ By specializing the auxiliary methods the generic merge algorithm can be used to perform basic set operations:
 - union
 - intersection
 - subtraction
- ◆ The running time of an operation on sets A and B should be at most $O(n_A + n_B)$

- ◆ Set union:
 - $aIsLess(a, S)$
 $S.insertFirst(a)$
 - $bIsLess(b, S)$
 $S.insertLast(b)$
 - $bothAreEqual(a, b, S)$
 $S.insertLast(a)$
- ◆ Set intersection:
 - $aIsLess(a, S)$
 $\{ \text{do nothing} \}$
 - $bIsLess(b, S)$
 $\{ \text{do nothing} \}$
 - $bothAreEqual(a, b, S)$
 $S.insertLast(a)$

Storing a Set in a List

- ◆ We can implement a set with a list
- ◆ Elements are stored sorted according to some canonical ordering
- ◆ The space used is $O(n)$

Generic Merging

- ◆ Generalized merge of two sorted lists A and B
- ◆ Template method `genericMerge`
- ◆ Auxiliary methods
 - `aIsLess`
 - `bIsLess`
 - `bothAreEqual`
- ◆ Runs in $O(n_A + n_B)$ time provided the auxiliary methods run in $O(1)$ time

Algorithm `genericMerge(A, B)`

```
 $S \leftarrow$  empty sequence  
while  $\neg A.isEmpty() \wedge \neg B.isEmpty()$   
     $a \leftarrow A.first().element(); b \leftarrow B.first().element()$   
    if  $a < b$   
        aIsLess(a, S); A.remove(A.first())  
    else if  $b < a$   
        bIsLess(b, S); B.remove(B.first())  
    else {  $b = a$  }  
        bothAreEqual(a, b, S)  
        A.remove(A.first()); B.remove(B.first())  
while  $\neg A.isEmpty()$   
    aIsLess(a, S); A.remove(A.first())  
while  $\neg B.isEmpty()$   
    bIsLess(b, S); B.remove(B.first())  
return  $S$ 
```

Using Generic Merge for Set Operations

- ◆ Any of the set operations can be implemented using a generic merge
- ◆ For example:
 - For **intersection**: only copy elements that are duplicated in both list
 - For **union**: copy every element from both lists except for the duplicates
- ◆ All methods run in linear time.
