Networks

Network Topologies

- A network is a communication system that provides correct, efficient, and robust data exchange between 2 or more hosts
- Local area network (LAN) —connects nodes in a small geographic area (e.g., single building, single campus)
 - Must be fast with low error rate
 - Media twisted-pair, coaxial cable, fiber optic cable
- Wide area network (WAN) —connects nodes in a wide geographic area (e.g., across the country)
 - May be slower with higher error rate
 - Media leased telephone lines (T1 & T3 service), microwave links, satellite channels

Network Topologies (cont.)

- Point-to-point links to specific nodes
 - Fully connected each node connects to all other nodes
 - Each message is fast; it takes only a single "hop" to reach its destination
 - Failure of any one node does not affect communication except to it
 - X Expensive!
 - Partially connected each node connects to some, but not all, nodes
 - Less expensive
 - A message may have to go though several other nodes
 - ✗ Less tolerant to failure

Tree — network hierarchy

- Messages between direct descendants are fast
- ✗ Messages between "cousins" must go up to a common ancestor and back down
- X Not tolerant of failures

3

Network Topologies (cont.)

- Star— all nodes connect to a single centralized node
 - ✓ Inexpensive
 - ✓ Each message takes only two hops
 - Failure of central node disconnects entire network
- Ring all nodes connect in a circle
 - One directional ring each node can send in only one direction
 ✓Inexpensive
 - X Message may need to take *n* hops
 - X Not tolerant of failures
 - Bi-directional ring send either way
- Bus all nodes connect to common network
 - ✓ Inexpensive, linear in number of nodes
 - ✓ Tolerant of node failures
 - X Only one node can send data at a time

Network Communication

- Connection-oriented communication
 - Information delivered as a stream of bytes, in correct order
 - Connect, exchange data, release
- Connectionless communication

5

- Information delivered as a set of *packets*
- Packets may be delivered out of sequence, must be reassembled
 Fall 2001, Lecture 15

Switching Technologies(cont.)

- Packet switching data is broken up into a sequence of fixed-size packets
 - Each packet is passed through the network from source to destination along some (possibly different) *route* (path)
 - At each node, the entire packet is received, stored briefly, and then forwarded to the next node
 - Datagram package switching
 - Packets are called *datagrams*
 - Each packet is routed independently
 A sequence of packets can be received out of order
 - Connectionless communication
 - Virtual circuit package (message) switching
 - All packets from one packet stream are sent along the same path (= virtual circuit)
 - Guarantees packets are received in sequence
 - Connection-oriented communication

Switching Technologies

- In a broadcast (or multiaccess) network, all hosts directly connect to a single shared communication medium
 - Each host check the destination address on every message to decide whether or not to read that message
- In a switched network, there is a partially-connected topology, and there may be multiple paths between two hosts
 - Messages may have to pass through intermediate nodes to reach destination
- Circuit switching a <u>dedicated</u> communication path is reserved, and then used to send the entire message
 - Connection occupies a fixed capacity (not necessarily entire capacity) of each link for the entire lifetime of the connection
 - Connection-oriented communication

Routing

- Routing software decides which path to use to move a message from the destination to source
- Routing is usually hop-by-hop, meaning each host chooses the next host to send the message to
- Static (fixed) routing routing tables are stored, and change very infrequently (e.g., after major the network changes)
 - ✓ Low setup cost, packets arrive in order
 - ✗ Can't react to changes in network load
- Dynamic routing routing tables are updated frequently
 - ✓ Can react to changes in network load
 - ✗ Higher setup cost for each packet
 - X Packets can arrive out of order
