# New York City Taxi Data (2010-2013) 

Brian Donovan and Dan Work

December, 2014

This dataset was obtained through a Freedom of Information Law (FOIL) request from the New York City Taxi \& Limousine Commission (NYCT\&L). It covers four years of taxi operations in New York City and includes 697,622,444 trips. Thanks to a generous hosting policy by the University of Illinois at Urbana Champaign, we are able to make this large dataset publicly available under the CCO license.

You are free to use the data as you wish, we only kindly ask you to consider citing the following works if you plan to publish subsequent results using the dataset:

Brian Donovan and Daniel B. Work. "Using coarse GPS data to quantify city-scale transportation system resilience to extreme events." presented at the Transportation Research Board 94th Annual Meeting, January 2015. preprint, source code.

Brian Donovan and Daniel B. Work"New York City Taxi Trip Data (2010-2013)". 1.0. University of Illinois at Urbana-Champaign. Dataset. http://dx.doi.org/10.13012/J8PN93H8, 2014.

Download the data here: http://dx.doi.org/10.13012/J8PN93H8
The data is stored in CSV format, organized by year and month. In each file, each row represents a single taxi trip. Table 1 below gives a small sample of this data. As there are several entries per second for four years, the raw trip data takes up about 116GB in text CSV format. The data has been compressed (zip) to reduce download time.

The data is organized as follows:
medallion: a permit to operate a yellow taxi cab in New York City, it is effectively a (randomly assigned) car ID. See also medallions.
hack license: a license to drive the vehicle, it is effectively a (randomly assigned) driver ID. See also hack license.
vender id: e.g., Verifone Transportation Systems (VTS), or Mobile Knowledge Systems Inc (CMT), implemented as part of the Technology Passenger Enhancements Project.
rate_code: taximeter rate, see NYCT\&L description.
store_and_fwd_flag: unknown attribute.
pickup datetime: start time of the trip, mm-dd-yyyy hh24:mm:ss EDT.
dropoff datetime: end time of the trip, mm-dd-yyyy hh24:mm:ss EDT.
passenger count: number of passengers on the trip, default value is one.
trip time in secs: trip time measured by the taximeter in seconds.
trip distance: trip distance measured by the taximeter in miles.
pickup_longitude and pickup_latitude: GPS coordinates at the start of the trip.
dropoff longitude and dropoff latitude: GPS coordinates at the end of the trip.
The medallion and hack licenses are reassigned each year, so it is only possible to track drivers and vehicles within each year. This is necessary for to render the data pseudo-anonymous, since de-anonymized data from 2013 can be reconstructed from existing published datasets, see the note on anonymity below.

Please note that the dataset contains a large number of errors. For example, there are several trips where the reported meter distances are significantly shorter than the straight-line distance, violating Euclidean geometry. For some periods, the field trip_time_in_secs is reported in
seconds, in others it is reported in minutes (see the first record above). Generally the trip time can be safely computed by subtracting the pickup_datetime from the dropoff_datetime. Additionally, many trips report GPS coordinates of ( 0,0 ), or cover impossible distances, times, or velocities. All of these types of obvious trip errors should be discarded in any analysis. In our preliminary investigations, these errors account for roughly $\mathbf{7 . 5 \%}$ of all trips. More details about these errors are available in the above article and corresponding open source code. Currently, only the raw data (no error filtering) is available for download via this site.

Fare data is also available from 2010-2014. The fare data takes about 75GB in raw text CSV format, and is also zipped to reduce download times. A sample of the fare data is shown in Table 2 below. The files are also organized by year and month, and contain the following attributes:
medallion: a permit to operate a yellow taxi cab in New York City, it is effectively a (randomly assigned) car ID. See also medallions.
hack license: a license to drive the vehicle, it is effectively a (randomly assigned) driver ID. See also hack license.
vender id: e.g., Verifone Transportation Systems (VTS), or Mobile Knowledge Systems Inc (CMT), implemented as part of the Technology Passenger Enhancements Project. pickup datetime: start time of the trip, mm-dd-yyyy hh24:mm:ss EDT.
payment type: Cash or credit card.
fare amount: the meter fare, it should include the Newark surcharge, in USD.
surcharge: Extra fees, such as rush hour and overnight surcharges, in USD.
mta tax: Metropolitan commuter transportation mobility tax, in USD.
tip amount: tip amount, in USD.
tolls amount: total price paid for tolls, summed across all tolls for the trip, in USD. total amount: all charges that are presented to the passenger at time of fare payment (includes tip for non-cash trips), in USD.

Again, note the medallion and hack licenses change each year.

## Table 1. A small subset of the New York City taxi trip data. Each row corresponds to an occupied taxi trip.
