# CSCI 3327 Visual Basic (Fall 2011) <br> Assignment \#4 

Instructor: Dr. Xiang Lian

Due Date: Oct. 10 (Monday), 2011
You have learnt the floating division (/) and integer division ( $($ ) in our previous Visual Basic class. Please design a demo interface for illustrating the results of these two types of divisions ( $\mathbf{1 0 0}$ points).

Input: dividend (in TextBox), divisor (in TextBox), and the selection of division type "/" or " " $\$ " (by clicking buttons)
Output: after clicking "calculate" button, output the division result.

Bonus (20 points): One fact we learnt about the integer division " $\backslash$ " in Visual Basic is that, when the dividend is a floating number, it will first be rounded to its nearest integer and then perform the integer division. For example, 8.1 is rounded to 8 , and 8.7 is rounded to 9 .

One interesting question is that, if the dividend is in the form of XXX.5, which is its nearest integer to be rounded to? XXX or (XXX +1 )?

Please design a set of experiments by using your demo program, and make the final conclusion. Write down your testing cases and reasons for your conclusion.

Please submit:

1. Program listing; and
2. The screen captures (see the Appendix).
3. For bonus, write down your testing cases and conclusion.

- Your program should begin with a comment section that would include the following:

PROGRAMMERS NAME:
STUDENT ID:
$\qquad$
CLASS: $\qquad$ ASSIGNMENT \#: $\qquad$
DATE DUE: $\qquad$ DATE TURNED IN: $\qquad$

- Note: Please send the files you created to Blackboard.

## Appendix: Examples of Screen Captures
